

Know My Customer Agent

Setup & Configuration Guide

A Custom Agent for Microsoft Copilot Studio

Developer: Power CAT | Version 1.0.0.1

Last Updated: May 4, 2026

Table of Contents

1. What Is Know My Customer?
2. Before You Start (Prerequisites)
3. Option A – Install from the Microsoft Marketplace (Agent Library)
4. Option B – Import the Solution into Copilot Studio
5. Option C – Publish to Microsoft Teams & M365 Copilot
6. Option D – Build the Agent from Scratch in Copilot Studio
7. Make It Your Own (Customization)
8. Test That It Works

1. What Is Know My Customer?

Know My Customer is a competitive intelligence agent built in Microsoft Copilot Studio. It researches companies, analyzes competitor landscapes, and generates executive-ready competitive briefs — all from a simple chat conversation.

What It Does

The agent operates in three phases to deliver competitive intelligence:

Phase	What Happens
 Search Phase	Runs a multi-stage research pipeline using web search to gather competitive intelligence from the last 8 months
 Content Phase	Synthesizes search results into a structured briefing with executive summary, market context, competitor key moves, tailwinds, and headwinds
 File Phase	Generates a professional Word document from the research, saves it to your OneDrive, and returns a shareable download link

Built-in Suggested Prompts

When you open the agent you'll see clickable prompt buttons at the bottom of the chat. Just click one to get started — no typing needed:

Button	What It Does
 Top Competitor	Identifies the top competitors for a company or product
 Create Competitive Intel	Generates a full competitive intelligence briefing for a company
 Recent Competitor Moves	Shows major competitor moves from the last 6–8 months
 Market Forces Impact	Analyzes key market forces affecting competitors and their significance
 Competitive Landscape Brief	Creates a competitive landscape summary for a company in a specific market
 Exec-Ready Competitive Brief	Generates an executive-ready competitive brief focused on a specific geography

How the Output Is Organized

The agent produces a structured competitive intelligence briefing with these sections:

- Title, Date, Client, Category, and Geography — report metadata
- Executive Summary — a concise overview of the competitive landscape
- Market Context — key market forces, their competitive effects, and suggested responses (max 3 bullets)

- Key Moves — a detailed table of competitor actions: product launches, partnerships, M&A, pricing changes, etc.
- Tailwinds & Headwinds — market-level forces impacting competitors
- Appendix — sources with dates accessed

2. Before You Start

Make sure the items below are in place before proceeding with any option. If any are missing, contact your IT administrator.

Checklist

✓	What You Need	Why
☐	Microsoft 365 work account	Required to sign in to Copilot Studio and Teams
☐	Microsoft Copilot Studio license	Gives you access to build and run agents in Copilot Studio
☐	Access to a Power Platform environment	The agent and its components live inside an environment

 **Note:** Each option section below has its own additional prerequisites. Check those before starting a specific option.

Which Option Should I Choose?

Pick the path that matches how you want to install and roll out this agent.

Option	Best For	You'll Need	Time
Option A – Microsoft Marketplace	Easiest install, ready-to-use experience, no admin needed	Microsoft 365 work account + Power Platform environment + permission to install marketplace apps (System Administrator or System Customizer in target environment)	~10 min
Option B – Import Solution	Fastest setup — uses the pre-built solution package	Copilot Studio access + solution .zip file	~5 min
Option C – Publish to Teams & M365 Copilot	Share the agent with your team via Microsoft Teams	Copilot Studio access + completed Option B	~10 min
Option D – Build from Scratch	Full control — learn how every piece works	Copilot Studio + Power Automate access	~45 min

3. Option A – Install from the Microsoft Marketplace (Agent Library)

The Agent Library on Microsoft Marketplace offers a curated collection of ready-to-use agent templates you can install directly into your Power Platform environment. Browse by category and deploy in minutes. For more information, visit our documentation on [Microsoft Learn](#).

What's Included in the Library

- **Agent templates for real business scenarios.** Each one follows Microsoft best practices and is ready to customize.
- **Two agent types supported.** Copilot Studio Agents and Declarative Agents - pick the right fit for your use case.
- **Guided configuration.** Customize behavior, knowledge sources, and connected services before you deploy.
- **Version tracking.** Know when updates are available and keep your deployed agents current.

Before You Begin

✓	What You Need	Why
☐	Microsoft 365 work account	Required to sign in to Microsoft Marketplace
☐	A target Power Platform environment	The marketplace app installs into a specific environment
☐	Permission to install marketplace apps in that environment	You need System Administrator or System Customizer security role in target environment
☐	Acceptance of the Marketplace terms of service	Required during the "Get it now" flow

How to Install

1. Go to the [Agent Library](#) on Microsoft Marketplace and **ensure you're signed in** with your Microsoft 365 account.

2. Select **Get it now**.
3. Select **Get it now** to confirm.
4. Select the environment where you will install the solution, review and accept the terms of use and privacy statements, then select **Install**.
5. You'll be redirected to Power Platform Admin Center. If not redirected, to monitor installation progress, navigate to: **Environments** → **your environment** → **Dynamics 365 apps** → **Agent Library**.
6. Once installed, go to **make.powerapps.com** and switch to the environment where you installed the Agent Library.
7. Navigate to **Apps** → **Agent Library**.
8. Browse the available templates and deploy your first agent.

 **Tip:** If you don't see the Agent Library or the Get it now button, ask your tenant admin to [enable Marketplace apps](#) for your environment.

 **Important:** This solution enables code components in your environment. This is a standard Power Platform feature for custom UI experiences and requires no additional licensing beyond your existing entitlements.

Deploy Know My Customer from the Library

1. Open the Agent Library app from **make.powerapps.com** → **Apps** → **Agent Library**.
2. Browse or search for **Know My Customer**.
3. Select the template, then select the environment you want to install the agent into
4. Ensure you connect to all of the required data sources (you may need to refresh the connections once they've been configured)
5. Click **Install** (or **Download** if you want to manually import the solution).
6. Once the installation completes, you'll see a "Your agent is ready!" message.
7. Click **Launch in Copilot Studio** to customize and publish.
8. Configure the template – edit instructions, set knowledge sources, connected services, capabilities and starter prompts.
9. Use the Test pane in Copilot Studio to test and verify the agent responds correctly
10. After you've tested, you can publish your agent.

Troubleshooting

Problem	Fix
"Get it now" button is greyed out	Sign in with a work or school account that has Marketplace access (personal Microsoft accounts are not supported)
No environments listed in the install dialog	Confirm you have admin permissions on at least one Power Platform environment
Install stuck in "Installing"	Check Power Platform admin center under Resources → Dynamics 365 apps; allow up to 15 minutes
App isn't opening correctly. " This environment does not allow this operation for this Code app."	Have a Power Platform admin enable Code app operations for the target environment
Agent Library app doesn't appear in make.powerapps.com → Apps	Confirm install completed and that you're viewing the same environment
Know My Customer template not visible in the library	Confirm the agent has been published to the Marketplace catalog

4. Option B – Import the Solution into Copilot Studio

This is the fastest way to get started. You'll upload the pre-built solution package directly into Copilot Studio, which sets up everything — the agent, its topics, actions, and AI models — in one step.

Before You Begin

✓	What You Need	Why
☐	Copilot Studio access at copilotstudio.microsoft.com	Where you'll import the solution
☐	System Customizer or System Administrator security role	Required to import solutions into an environment
☐	KnowMyCustomer_1_0_0_1.zip file	The solution package — do not unzip or rename it

 **Important:** Do not unzip, rename, or modify the .zip file. Copilot Studio needs the original package as-is.

Import the Solution

1. Open your browser and go to copilotstudio.microsoft.com. Sign in with your Microsoft 365 work account.
2. In the top-right corner, make sure the correct environment is selected. If not, click the environment name and switch to the one you want to use.
3. In the left navigation menu, click Settings (the gear icon ) at the bottom.
4. Under the Settings menu, click Solutions. This opens the Solutions list page.
5. Click the Import button at the top of the solutions list.
6. Click Browse, navigate to where you saved the KnowMyCustomer_1_0_0_1.zip file, select it, and click Open.
7. Click Next. Copilot Studio will validate the package. If prompted about connection references (e.g., Word Online, OneDrive for Business), sign in with your Microsoft 365 account for each one.
8. Click Import. The import process may take 1–3 minutes. Wait for the green success banner.

 **The solution is imported! The Know My Customer agent is now in your environment.**

Find and Open Your Agent

1. In the left navigation menu, click Agents.
2. Look for "Know My Customer" in the agents list. Click on it to open the agent.
3. The agent overview page shows its topics, actions, and settings. You can now test it by clicking the Test button in the top-right corner.

 **Tip:** After importing, the agent may take a minute to become fully available. If you don't see it immediately in the agents list, refresh the page.

Set Up the Cloud Flow Connections

The agent includes a Power Automate cloud flow called "KMC - File Generation" that creates Word documents from research reports. After import, you need to verify its connections are active:

1. From the agent overview page, click on Actions in the left panel (or go to Flows in the left navigation).
2. Find the flow named "KMC - File Generation" and click on it to open it.
3. If you see any connection warnings (yellow or red icons), click on each connection and sign in with your Microsoft 365 account. The flow uses three connections:
 - Dataverse — for running the AI Builder prompt
 - Word Online (Business) — for populating the Word template
 - OneDrive for Business — for saving the generated document and creating a sharing link
4. Once all connections show a green checkmark, the flow is ready.

 **Note:** The flow connections run with your credentials. Each user who uses the agent will be asked to authorize these connections the first time they trigger file generation.

 **Note:** Word Online actions need to be updated with the template location; it can be in SharePoint or OneDrive

Troubleshooting

Problem	Fix
Import button is grayed out	You may not have the System Customizer or System Administrator role. Contact your IT admin.
Import fails with dependency errors	Make sure you're importing into an environment that has Copilot Studio enabled and the required connectors available.
Agent not appearing after import	Wait 1–2 minutes and refresh the page. If still missing, check the Solutions list to confirm the import succeeded.
Flow connection errors after import	Open the flow, click each connection, and sign in. If a connection type is blocked in your org, contact your admin.
"Solution already exists" error	The solution was previously imported. Go to Solutions, find KnowMyCustomer, and either delete it first or use the overwrite option.

5. Option C – Publish to Microsoft Teams & Copilot Channels

After importing the solution (Option B), you can make the agent available to your colleagues through Microsoft Teams and Microsoft 365 Copilot. This section walks you through publishing the agent to these channels and configuring the Teams app.

 **Note:** You must complete Option B first. The agent needs to be in Copilot Studio before it can be published to channels.

Step 1: Publish the Agent

Before connecting any channels, you need to publish the agent so the latest version is live:

1. Open Copilot Studio at copilotstudio.microsoft.com and navigate to your Know My Customer agent.
2. Click the Publish button in the top-right corner of the agent overview page.
3. Wait for the publishing to complete. You'll see a green success banner when it's done.

Step 2: Connect the Teams Channel

1. From the agent overview page, click Channels in the left navigation panel.
2. Find Microsoft Teams in the list of available channels and click on it.
3. Click Turn on Teams to enable the channel. The Teams channel configuration panel opens.

Configure the Teams App Details

The Teams channel panel lets you customize how the agent appears in Microsoft Teams. Fill in each section:

1. **App Icon** — Upload a color icon (192×192 pixels, PNG) and an outline icon (32×32 pixels, PNG). These appear in Teams when users browse for your agent.
2. **Accent Color** — Enter a hex color code (e.g., #0078D4 for blue) that matches your brand. This appears behind your icon in Teams.
3. **Short Description** — Enter a brief one-liner, e.g., "Competitive intelligence agent that researches companies and generates executive-ready briefings."
4. **Long Description** — Enter a full description of what the agent does, its features, and how users can interact with it.
5. **Developer Information** — Enter the developer name (e.g., your team or organization name), website URL, privacy statement URL, and terms of use URL.

6. Team Channel Access (optional) — If you want users to @mention the agent in team channels (not just 1:1 chat), toggle on "Allow your users to add this agent to a team."

Enable Microsoft 365 Copilot Channel

To also make the agent available inside Microsoft 365 Copilot (m365.cloud.microsoft/chat):

1. Go back to the Channels page.
2. Find Microsoft 365 Copilot in the channel list and toggle it On.

 **Tip:** This allows users to find the agent in the M365 Copilot side panel and @mention it in Copilot conversations.

Step 3: Install for Yourself First

1. In the Teams channel configuration panel, click See agent in Teams. This opens a pop-up in Microsoft Teams.
2. Click Add to install the agent for yourself. This lets you test it before sharing with others.
3. The agent now appears in your Teams chat list. Send it a test message to confirm everything works.

Step 4: Share with Others

There are three ways to share the agent with colleagues:

Method 1: Direct Installation Link

1. In the Teams channel panel, click Copy link under "Share the link with others".
2. Send this link to colleagues via email or Teams chat. When they click it, they'll be prompted to install the agent.

Method 2: Built with Power Platform

1. In the Teams channel panel, under Availability, click Edit under "Show in Built with Power Platform".
2. Toggle on "Show to my teammates and shared users". Anyone you've shared the agent with can find it in the Teams app store under "Built with Power Platform".

Method 3: Submit for Admin Approval

1. In the Teams channel panel, under Availability, click Submit for admin approval.

2. Fill in the required information and submit. Your Teams/IT admin will review and can approve it for the entire organization.
3. Once approved, the agent appears in the Teams app store under "Built for your org" — available to everyone in your company.

 **Tip:** Method 3 (admin approval) is the best option for broad organizational rollouts. It makes the agent discoverable by all employees in the Teams app store.

Advanced: Download the App Manifest

If you prefer to distribute the agent manually (e.g., sideload into Teams yourself), you can download the Teams app manifest:

1. In the Teams channel panel, scroll to the bottom and click Download manifest.
2. This downloads a .zip file containing the Teams app manifest. You can upload this .zip through the Teams admin center or sideload it directly.

How to Access After Publishing

Where	How to Open
Teams Chat	Open Teams → click on the agent in your chat list (or search for it)
Teams App Store	Open Teams → Apps → search for the agent name → Add
Team Channel (@mention)	In any Teams channel, type @Know My Customer followed by your question (only if team channel access is enabled)
Microsoft 365 Copilot	Go to m365.cloud.microsoft/chat → click the side-panel icon → select Know My Customer

Pin the Agent for Quick Access

Pin the agent to your Teams sidebar so it's always one click away:

1. In Teams, find the agent in your chat list or app list.
2. Right-click (or click the ⋮ menu) on the agent.
3. Select Pin. The agent now appears in your left sidebar.

Troubleshooting

Problem	Fix
"See agent in Teams" not working	Make sure you've published the agent first. The Teams channel requires a published version.
Agent not appearing in Teams	Wait 1–2 minutes after publishing. If still missing, close and reopen Teams.

Problem	Fix
Users can't find the agent	If using the Built with Power Platform method, make sure you've toggled on visibility. If using admin approval, check if the admin has approved it.
Agent responds with SystemError	Open the cloud flow and verify all connections are active and signed in.
Installation link doesn't work on mobile	Direct installation links may not work on the Teams mobile app. Users can search for the agent in the Teams app store instead.

6. Option D – Build the Agent from Scratch in Copilot Studio

This option walks you through building the entire Know My Customer agent from the ground up in Copilot Studio. It's the best choice if you want to deeply understand how every piece works, or if you want to customize the agent beyond what the imported solution provides.

 **Important:** This is the longest option (~45 minutes). If you just want a working agent quickly, use Option B instead. This option is for users who want to learn and customize.

Before You Begin

✓	What You Need	Why
☐	Copilot Studio access at copilotstudio.microsoft.com	Where you'll build the agent
☐	Power Automate access	Required to create the file generation cloud flow
☐	AI Builder access (included with Copilot Studio license)	Required to create the AI prompt that structures report data
☐	OneDrive for Business	Where the generated Word documents will be saved
☐	A SharePoint site (optional)	If you want to store the Word template centrally instead of on OneDrive

This section is organized into five parts:

- Part 1: Create the Agent
- Part 2: Configure the Agent Settings & Instructions
- Part 3: Create the Word Template for Report Generation
- Part 4: Create the AI Builder Prompt for Structured Data Extraction
- Part 5: Create the Power Automate Cloud Flow (File Generation Action)
- Part 6: Connect the Cloud Flow to the Agent

Part 1: Create the Agent

1. Open your browser and go to copilotstudio.microsoft.com. Sign in with your Microsoft 365 work account.
2. In the top-right corner, make sure you are in the correct environment.
3. In the left navigation menu, click Agents.
4. Click + New agent at the top of the page.

- Click Skip to configure (at the bottom of the wizard) to go directly to the agent configuration page.

Part 2: Configure the Agent Settings & Instructions

Name & Description

Fill in the following fields on the agent configuration page:

Field	What to Enter
Name	Know My Customer
Description	A competitive intelligence agent that researches companies, analyzes competitor landscapes, and generates executive-ready competitive briefs.

Instructions

Scroll down to the Instructions box. Copy and paste everything in the box below into that field. These instructions tell the agent how to behave — what phases to follow, how to structure output, and when to generate files:

```
# Know My Customer – RELIABLE PDF / FILE GENERATION INSTRUCTIONS

The agent operates in three deterministic phases but each phase can be triggered separately:

0. PRE-REQUISITES :
- If the user has not specified a company or a product name, ASK: "Which company would you like me to research?"
- NEVER default to "Contoso" or any placeholder company
- NEVER proceed to Search, Content, or File phases without a confirmed client or product name

1. SEARCH PHASE – Run the Research Component topic if the user needs competitive intel.

SCOPE GUARDRAIL: All searches and responses must stay within the COMPETITIVE INTELLIGENCE domain. This includes:
- Market positioning, competitor moves, partnerships, M&A, pricing strategies, product launches, executive changes, financial performance, market share

If a query could be interpreted as either competitive intelligence OR product support, ASK the user to clarify.

2. CONTENT PHASE – Produce universal plain-text content, provide a card in the conversation formatted with sections and emojis

3. FILE PHASE – Trigger the KMC - File Generation action and return a Markdown link

If a requested phase is missing required upstream outputs, the agent MUST execute the minimal required upstream phase(s) in this order: Search → Content → File.
If the user doesn't ask to generate a file, don't trigger phase 2 and 3.

## 1. SEARCH PHASE
When the user requests intelligence, insights, a brief, a scan, analysis, or a summary:
```

```

- Perform Search Sources call for each section retrieving all relevant competitive intelligence
- Competitor STRICTLY means other companies competing with the client (never the client)
- All searches must be limited to information from the last 8 months

## 2. CONTENT PHASE - STRUCTURED OUTPUT (MANDATORY)
From the search results, build a dataset named structured_content.

### Required Fields
- Filename: containing the Title and .docx extension
- Title
- Date
- Client
- Category
- Geography
- Executive Summary
- Market Context – Max 3 bullets. Each bullet MUST follow: Market force -> Competitive effect -> Why it matters to client -> Suggested response
- Key Moves – Table with columns: Competitor | Move Type | What Happened | Why It Matters | Confidence | Who Is Affected | Evidence
- Tailwinds & Headwinds – Market-level forces impacting competitors
- Appendix – Sources with date accessed

## 3. FILE PHASE - FILE OUTPUT RULES
- Generate the final document ONLY if the user requests a document
- Return exactly ONE Markdown download link

```

 **Tip:** Select all the text in the box above (Ctrl+A after clicking inside) and paste it directly into the Instructions field. The markdown formatting (## headers, - dashes) will help the agent interpret the structure correctly.

AI Settings

Configure the following AI settings for the agent:

1. In the agent settings, find the AI capabilities section.
2. Enable Web browsing — this allows the agent to search the web for competitive intelligence.
3. Enable Code interpreter — this helps the agent process and format structured data.
4. Set Content moderation to High for responsible AI compliance.
5. Enable Generative actions (also called "Allow the AI to use its own general knowledge") — this lets the agent use its built-in knowledge to fill gaps when web search results are insufficient.

 **Note:** Generative actions must be enabled for the agent to automatically call the file generation flow when needed.

Conversation Starters

Scroll down to the Starter Prompts section. Add these prompts so users see clickable quick-start buttons:

Title	Prompt Text
Top Competitor	Who are the top competitor to [Customer/Product]
Create Competitive Intel	I need competitive intel details for [Company]
Recent Competitor Moves	What major moves have competitors of [Customer] made in the last 6–8 months?
Market Forces Impact	Analyze the key market forces affecting competitors of [Customer] and why they matter.
Competitive Landscape Brief	Create a competitive landscape summary for [Customer] in the [Industry] market.
Exec-Ready Competitive Brief	Generate an executive-ready competitive brief on [Customer]'s competitors in [Geography].

1. Click + Add prompt for each one, then enter the Title and the Prompt Text.
2. After adding all six prompts, click Save.

Part 3: Create the Word Template for Report Generation

The agent's file generation action uses a Microsoft Word template to produce professional-looking reports. The template contains placeholder fields (called Content Controls) that get filled in automatically with data from the AI.

 Note: you can find in the BOM the word template KMC.

What Is a Content Control?

A Content Control is a special placeholder in a Word document. Think of it like a fill-in-the-blank field. When the Power Automate flow runs, it replaces each content control with actual data (e.g., the company name, executive summary, etc.).

Create the Template

1. Open Microsoft Word (the desktop app) and create a new blank document.
2. Design a professional report layout. Include headers, your organization's branding, and placeholder areas for each section of the competitive intelligence report.
3. For each data field, insert a Plain Text Content Control. To do this:
 - Go to the Developer tab in the Word ribbon. (If you don't see the Developer tab, go to File → Options → Customize Ribbon → check Developer.)
 - Place your cursor where you want the data to appear.
 - Click the Plain Text Content Control button (it looks like Aa).
 - Click Properties on the Developer tab to give the content control a descriptive title.

Required Content Controls

Create one Plain Text Content Control for each of these fields:

Content Control Title	What It Will Contain	Where to Place It
Title	The report title (e.g., 'Competitive Intel: Acme Corp')	At the top of the document as the main heading
Date	The report generation date	Below the title
Client	The company being researched	In the report metadata section
Category	The industry category	In the report metadata section
Geography	The geographic focus of the research	In the report metadata section
ExecutiveSummary	A concise summary of the competitive landscape	In the first body section
MarketContextLine	Key market forces as bullet points	In the Market Context section
Key_Moves	The competitor moves table (formatted as text)	In the Key Moves section
Tailwinds	Positive market forces for the client	In the Tailwinds & Headwinds section
Headwinds	Negative market forces or risks	In the Tailwinds & Headwinds section

4. Save the template as a .docx file.

5. Upload the template to a SharePoint document library or OneDrive folder that the Power Automate flow can access. Note the location — you'll need it in Part 5.

 **Tip:** The content control titles must match exactly the names listed above (case-sensitive). The Power Automate flow uses these titles to know where to insert data.

 **Important:** Make sure the Word template is saved in SharePoint or OneDrive — NOT on your local hard drive. The Power Automate flow needs to access it from the cloud.

Part 4: Create the AI Builder Prompt for Structured Data Extraction

The file generation flow needs a way to take the free-text research report and extract specific data fields (Title, Client, Date, etc.) into a structured format. This is done with an AI Builder custom prompt.

What Is an AI Builder Prompt?

An AI Builder prompt is a set of instructions you give to an AI model. You describe what data you want extracted, and the AI returns it in a structured format. Think of it as a smart parser that reads the research text and pulls out the key fields.

Create the Prompt

1. In Copilot Studio, click on your agent → Tools → Add a tool → New tool → Prompt.
(Alternatively, go to Power Automate at make.powerautomate.com → AI hub → Prompts → Build your own prompt.)
2. Give the prompt a name, such as "KMC Report Data Extractor".
3. In the prompt editor, write instructions that tell the AI to extract specific fields. Here's a recommended prompt:

You are a data extraction assistant. Given a competitive intelligence report, extract the following fields and return them as structured JSON:

- Filename: A descriptive filename ending in .docx (e.g., "Competitive_Intel_Acme_Corp_2026.docx")
- Title: The report title
- Date: Today's date in MMMM DD, YYYY format
- Client: The company being researched
- Category: The industry or market category
- Geography: The geographic focus
- ExecutiveSummary: A 2-3 sentence executive summary
- MarketContextLine: Key market forces as a concise summary
- Key_Moves: A summary of competitor moves in table format
- Tailwinds: Positive market forces (bullet points)
- Headwinds: Negative market forces (bullet points)

Return ONLY the JSON object, no additional text.

4. Add an input variable by typing / or clicking "Add content" in the prompt editor. Select Text, name it "Content" (this will receive the research report text).
5. Reference the input in your prompt by inserting the Content variable where the AI should read the report text.

Configure Structured Output

To get the AI's response in a predictable format that Power Automate can use:

6. In the prompt settings, look for the "Output" or "Response format" section.
7. Add output fields for each piece of data you want extracted:

Output Field Name	Type	Description
filename	Text	The generated report filename
Title	Text	Report title
Date	Text	Report date
Client	Text	Company being researched
Category	Text	Industry category
Geography	Text	Geographic focus
ExecutiveSummary	Text	Executive summary paragraph
MarketContextLine	Text	Market context bullet points
Key_Moves	Text	Competitor moves summary
Tailwinds	Text	Positive market forces

Output Field Name	Type	Description
Headwinds	Text	Negative market forces

8. Click Test to verify the prompt works. Paste some sample research text and check that the output fields are populated correctly.

9. Click Save when you're satisfied with the results.

 **Tip:** Test the prompt multiple times with different company research texts to ensure it reliably extracts data. Adjust the prompt wording if the AI misinterprets any fields.

Part 5: Create the Agent Flow (File Generation Action)

This is the action that ties everything together. The cloud flow takes the research report from the agent, uses the AI Builder prompt to extract structured data, fills in the Word template, saves the document to OneDrive, and returns a download link back to the agent.

What Is a Agent Flow?

An Agent flow is an automated workflow that runs in the cloud. Think of it as a recipe: when something happens (the agent asks for a file), a series of steps run automatically (extract data → fill template → save file → create link). You build these steps using a visual drag-and-drop designer — no coding required.

What Is a Connector?

Connectors are pre-built integrations that allow the flow to talk to other services. For this flow, you'll use three connectors:

Connector	What It Does	Icon to Look For
AI Builder	Runs the AI prompt to extract structured data from the report	Purple AI/brain icon
Word Online (Business)	Fills in the Word template with the extracted data	Blue W icon
OneDrive for Business	Saves the populated document and creates a sharing link	Blue cloud icon

Create the Flow Step by Step

Follow these steps carefully. Each step adds one piece of the workflow.

Step A: Create a New Agent Flow

1. In Copilot Studio, go to the left navigation menu and click Flows (or Agent Flows).
2. Click + New flow at the top of the page.

3. The flow designer opens with a starter template. You'll see two blocks already in place: "When an agent calls the flow" (the trigger) at the top, and "Respond to the agent" (the response) at the bottom.
4. Click on "When an agent calls the flow" (the trigger block at the top). This is where you define what information the agent sends to the flow.
5. Click + Add an input inside the trigger block. Select Text as the type. Name it "Report" — this is where the agent's research report text will be sent.

Note: The trigger block is what starts the flow. Every time the agent needs to generate a file, it sends the research report text through this trigger.

Step B: Add the AI Builder Action (Run a Prompt)

6. Click the + (plus) icon between the trigger and the "Respond to the agent" action. This adds a new step to your flow.
7. In the "Add an action" panel that appears, search for "Run a prompt" or "AI Builder". Select the Run a prompt action.
8. In the action settings, click on the Prompt dropdown and select the AI Builder prompt you created in Part 4 (e.g., "KMC Report Data Extractor").
9. In the Content input field, click on it and select the dynamic content "Report" from the trigger. This passes the agent's research text into the AI prompt.

Tip: If you don't see your prompt in the dropdown, make sure you saved and published it in Part 4. You may also need to click 'See more' or search by name.

Step C: Add the Word Template Action (Populate a Microsoft Word Template)

10. Click the + (plus) icon below the "Run a prompt" step to add another action.
11. Search for "Populate a Microsoft Word template" in the action search. Select it (it's under the Word Online (Business) connector).
12. If prompted to sign in, use your Microsoft 365 account to authorize the Word Online connector.
13. In the Location field, select the SharePoint site or OneDrive location where you saved the Word template in Part 3.
14. In the Document Library field, select the library containing your template.
15. In the File field, browse to and select your Word template (.docx).
16. Once you select the template, the action automatically shows fields for each content control in your template. Map each field to the corresponding AI Builder output:

Template Field	Map To (Dynamic Content)
Title	Run a prompt → Title (under structuredOutput)
Date	Run a prompt → Date (under structuredOutput)
Client	Run a prompt → Client (under structuredOutput)
Category	Run a prompt → Category (under structuredOutput)
Geography	Run a prompt → Geography (under structuredOutput)
ExecutiveSummary	Run a prompt → ExecutiveSummary (under structuredOutput)

Template Field	Map To (Dynamic Content)
MarketContextLine	Run a prompt → MarketContextLine (under structuredOutput)
Key_Moves	Run a prompt → Key_Moves (under structuredOutput)
Tailwinds	Run a prompt → Tailwinds (under structuredOutput)
Headwinds	Run a prompt → Headwinds (under structuredOutput)

 **Important:** Each field must be mapped to the correct AI Builder output. If you mix them up, the report sections will contain the wrong data. Double-check that Title goes to Title, Client goes to Client, etc.

Step D: Add the Create File Action (Save to OneDrive)

17. Click the + (plus) icon below the Word template step. Search for "Create file" and select the Create file action under OneDrive for Business.
18. If prompted, sign in with your Microsoft 365 account.
19. In the Folder Path field, enter / (the root of your OneDrive) or navigate to a specific folder where you want generated reports saved.
20. In the File Name field, click on it and select the dynamic content "filename" from the Run a prompt output. This gives each report a descriptive, AI-generated filename.
21. In the File Content field, click on it and select the output body from the "Populate a Microsoft Word template" step. This is the populated Word document.

Step E: Add the Create Sharing Link Action

22. Click + below the Create file step. Search for "Create share link" and select it (under OneDrive for Business).
23. In the File ID field, select the dynamic content "Id" from the Create file step. This tells the action which file to create a link for.
24. Set the Link type to "View" (read-only) and the Scope to "Organization" (anyone in your company can access it).

Step F: Configure the Response Back to the Agent

25. Click on the "Respond to the agent" block at the bottom of the flow.
26. Click + Add an output inside the response block. Select Text as the type. Name it "Link".
27. In the value field for "Link", select the dynamic content "WebUrl" from the Create share link step. This sends the file's shareable URL back to the agent, which displays it to the user.

Step G: Name and Publish the Flow

28. Click on the flow name at the top-left of the designer (it may say "Untitled"). Rename it to "KMC - File Generation".
29. Click Publish (or Save) in the top-right corner. Wait for the green success confirmation.

 **The cloud flow is now published and ready to be connected to the agent!**

Flow Summary — What Each Step Does

Here's a visual summary of the complete flow:

Step #	Action	What It Does
Trigger	When an agent calls the flow	Receives the research report text from the agent
1	Run a prompt (AI Builder)	Sends the report to the AI prompt, which extracts structured fields (Title, Client, Date, etc.)
2	Populate a Microsoft Word template	Takes the structured data and fills in the Word template, producing a formatted document
3	Create file (OneDrive)	Saves the formatted Word document to the user's OneDrive with an AI-generated filename
4	Create share link (OneDrive)	Creates a shareable link (view-only, organization-wide) for the saved document
Response	Respond to the agent	Sends the shareable link URL back to the agent, which displays it to the user as a download link

Part 6: Connect the Cloud Flow to the Agent

Now that the flow is published, you need to connect it to your Know My Customer agent so the agent can call it when a user requests a file.

Option 1: Using Generative Actions (Recommended)

If you enabled Generative Actions in Part 2 (AI Settings), the agent can automatically discover and use published flows in the same environment. To confirm:

1. Go back to your Know My Customer agent in Copilot Studio.
2. Click Tools in the left navigation panel.
3. Click + Add a tool at the top.
4. Select Flow in the filter. Your "KMC - File Generation" flow should appear in the list.
5. Click on the flow to add it, then click Add and configure.
6. Under Name, ensure it says "KMC - File Generation". Under Description, enter: "Generates a professional Word document from a competitive intelligence research report, saves it to OneDrive, and returns a shareable download link."
7. Under Inputs, set the Report input to "Let the AI fill this value" so the agent automatically passes the research content.
8. Under Completion, select "Send a message to the user" so the agent shares the download link after file generation.
9. Click Save.

 **The flow is now connected to the agent as a tool!**

Option 2: Calling the Flow from a Topic

If you prefer explicit control over when the flow runs, you can call it from within a topic:

1. In your agent, go to Topics and create a new topic (or edit an existing one).
2. Add trigger phrases like: "generate a report", "create a file", "download the briefing".
3. Add a message node that says: "I'll generate your competitive intelligence report now. This may take a moment..."
4. Click the + icon below the message node and select Add a tool.
5. Select your "KMC - File Generation" flow from the list.
6. Set the Report input to the variable containing the research content.
7. Below the action node, add another message node that displays the output: "Here is your report: " followed by the Link output variable from the flow.
8. Click Save.

 **Tip:** Option 1 (Generative Actions) is simpler and recommended — the agent's AI automatically decides when to call the flow based on the user's request. Option 2 gives you explicit control but requires you to build the topic logic yourself.

Test & Create

1. Click the Test button in the top-right corner of Copilot Studio.
2. Type a test prompt like: "I need competitive intel details for Microsoft"
3. The agent should perform web research, compile the findings, and if you ask for a file, generate a Word document and return a download link.
4. Click the link to verify the Word document opens correctly with all sections populated.

 **Note:** The first time you test file generation, you may be prompted to authorize the flow's connections (Word Online, OneDrive). Sign in when prompted.

7. Make It Your Own

Once the agent is running, you can customize it to fit your team's needs.

If You Imported the Solution (Option B)

1. In Copilot Studio, go to Agents and click on Know My Customer.
2. Click on Topics, Actions, or the agent's Settings to modify different aspects.
3. To edit the agent's instructions, click on the agent overview and scroll to the Instructions section.
4. Make your changes and click Save, then Publish to push the updates live.

If You Built from Scratch (Option D)

1. Open your agent in Copilot Studio.
2. Navigate to the section you want to change (Topics, Tools, Instructions, etc.).
3. Make your edits and save.
4. Click Publish to make your changes live.

What You Can Change

Customization	How to Do It
Change the agent's tone	Edit the Instructions — adjust the language style and formality level
Modify report sections	Edit the AI Builder prompt and the Word template to add, remove, or rename fields
Add or remove starter prompts	Go to the agent's Conversation Starters section and add/remove prompts
Restrict to specific industries	Add scope restrictions to the Instructions (e.g., 'Only research companies in the healthcare industry')
Change where files are saved	Edit the Power Automate flow's Create File step to point to a different OneDrive folder or SharePoint library
Update the Word template design	Edit the Word template in SharePoint/OneDrive, changing fonts, colors, logos, or layout. The content controls stay the same.
Add new data sources	In the agent settings, add knowledge sources (SharePoint sites, files) for the agent to reference during research
Limit to specific geographies	Add geographic restrictions to the Instructions (e.g., 'Focus research on the North American market only')

 **Tip:** Always test your changes after making edits. Use the Test panel in Copilot Studio to verify the agent still works correctly before publishing.

8. Test That It Works

Quick Smoke Test

Try these prompts to verify the agent is working correctly:

#	Try This Prompt	What to Look For
1	Who are the top competitors to Microsoft?	Agent should identify 3-5 major competitors with brief descriptions
2	I need competitive intel details for Salesforce	Agent should research Salesforce, produce a structured briefing with executive summary, market context, and key moves
3	What major moves have competitors of Apple made in the last 6–8 months?	Agent should list recent competitor actions with dates, move types, and significance
4	Create a competitive landscape summary for Tesla in the electric vehicle market.	Agent should produce a comprehensive landscape brief covering the EV market
5	Generate an executive-ready competitive brief on Amazon's competitors in North America. Please create a Word document.	Agent should research, compile, AND generate a Word doc with a shareable link

⚠️ Note: Test #5 specifically tests the file generation action. If the agent returns a download link to a Word document, the flow is working correctly. If it doesn't, check the flow connections (see Troubleshooting in Section 3).

What to Verify for File Generation

When testing the file generation (Test #5 above), check these things:

1. The agent should display a message indicating it's generating the file.
2. After a short wait (30–60 seconds), the agent should return a clickable download link.
3. Click the link — it should open a Word document in your browser (OneDrive online viewer).
4. The document should contain all sections: Title, Date, Client, Category, Geography, Executive Summary, Market Context, Key Moves, Tailwinds, and Headwinds.
5. The content should match the research the agent performed in the chat conversation.

Troubleshooting File Generation

Problem	Fix
Agent doesn't offer to generate a file	Make sure Generative Actions is enabled and the flow is added as a tool. Also check that your instructions include the File Phase section.
File generation takes too long (>2 minutes)	Check the Power Automate flow run history for errors. The AI Builder prompt step is usually the longest.
Link opens but document is empty	Check the Word template's content controls — their titles must exactly match the AI Builder prompt's output field names.
Error: 'Flow run failed'	Open Power Automate (make.powerautomate.com), find the flow, and check the run history. Click on the failed run to see which step failed and why.
Error: Connection expired	Open the flow, click on the failing connection, and re-authenticate with your Microsoft 365 account.
Document has wrong data in sections	Check the field mapping in the 'Populate a Microsoft Word template' step. Each content control must be mapped to the correct AI Builder output.

Full Evaluation

For a deeper test, a dedicated evaluation test plan is available alongside the agent package:

File	What It Is
Know My Customer Agent - Evaluation Test Plan.pdf	Detailed test plan with pass/fail criteria and import instructions
